

## Section 6.1 $L^p$ Spaces

**Definition.** A measurable function  $f : [0, 1] \rightarrow \mathbb{R}$  is said to be in the space  $L^p = L^p([0, 1])$  if

$$\int_a^b |f|^p < \infty.$$

Note the following

- (1)  $L^1$  is the space of integrable functions
- (2)  $L^p$  is closed under  $+$  and under scalar multiplication i.e.,

The  $L^p$  is defined as equivalence classes as follows:

$$\left\{ f : \text{measurable and } \int |f|^p < \infty \right\} / \sim f = g \text{ a.e.}$$

(mod out by functions that are equal almost everywhere)

**Definition.**  $()$

**Definition.** The  $L^p$ -norm on  $L^p$  space is defined as

$$\|f\|_p := \left( \int_0^1 |f|^p \right)^{1/p}.$$

If  $p \in (0, 1)$ , then  $\|f + g\|_p \leq \|f\|_p + \|g\|_p$ . We want to show that  $\|f + g\|_p \leq \|f\|_p + \|g\|_p$  for  $p \in [1, \infty]$ .

**Definition.** For  $p = \infty$ , the space  $L^\infty$  is the set of bounded measurable functions for  $f \in L^\infty$ . Then

$$\begin{aligned} \|f\|_\infty &= \text{ess sup } |f(x)| \\ &= \inf \{M : m\{t : f(t) > M\} = 0\}. \end{aligned}$$

Note that  $\|\cdot\|_\infty$  is the limit of  $\|\cdot\|_p$  i.e.,

$$f \in L^\infty, \|f\|_p \rightarrow \|f\|_\infty.$$

## Section 5.5 Convex Functions

**Definition.** A function  $\phi : [a, b] \rightarrow \mathbb{R}$  is **convex** if for all  $x, y \in [a, b]$  and for all  $\lambda \in (0, 1)$ , we have that

$$\phi(\lambda x + (1 - \lambda)y) \leq \lambda \phi(x) + (1 - \lambda)\phi(y)$$

**Proposition (5.17).**

If  $\phi$  is convex on  $[a, b]$  then

- (1) - (don't care about this)
- (2) Right-hand and left-hand derivatives are equal except on a countable set.

- (3) The left- and right-hand derivatives are monotone increasing functions, and at each point the left-hand derivative is less than or equal to the right-hand derivative.

**Corollary (5.19).** If  $\phi$  is twice-differentiable, then  $\phi$  is convex if and only  $\phi''(x) > 0$ .

**Corollary (5.20, Jensen's Inequality).** Let  $\phi$  be a convex function on  $(-\infty, \infty)$  and  $f$  be an integrable function  $[0, 1]$ . Then

$$\int_0^1 \phi(f(t)) dt \geq \phi \left[ \int_0^1 f(t) dt \right].$$

An example of this is  $\phi(x) = x^p$ . For any  $p \in (1, \infty)$ , this function is twice-differentiable. Applying Jensen's inequality, we get

$$\int_0^1 |f(x)|^p dx \geq \left( \int_0^1 |f(x)| dx \right)^p.$$

If  $f \in L^p$ , then  $f \in L^1$  i.e.,  $L^p \subset L^1$ .

**Theorem (6.1, Minkowski Inequality).** If  $f, g \in L^p$  with  $p \in [1, \infty]$ , then  $f + g \in L^p$  and

$$\|f + g\|_p \leq \|f\|_p + \|g\|_p.$$

If  $p \in (1, \infty)$ , then the equality can hold only if and only if there exists  $\alpha, \beta \geq 0$  such that  $\beta f = \alpha g$ .

*Proof.* We leave  $p = \infty$  as exercise so suppose  $p$  is finite. Let  $p \in [1, \infty]$ . We normalize  $f$  and  $g$  i.e., there exists two functions  $f_0, g_0 \in L^p$  such that  $|f| = \alpha \cdot f_0$  and  $|g| = \beta \cdot g_0$  with  $\|f_0\| = \|g_0\| = 1$ . Let  $\lambda = \frac{\alpha}{\alpha + \beta}$  and  $1 - \lambda = \frac{\beta}{\alpha + \beta}$ . By the convexity of  $\phi(t) = t^p$  for  $p \in [1, \infty]$ , we have that

$$\begin{aligned} |f(x) + g(x)|^p &\leq (|f(x)| + |g(x)|)^p \\ &= (\alpha f_0 + \beta g_0)^p \\ &= (\alpha + \beta)^p \left( \frac{\alpha}{\alpha + \beta} f_0 + \frac{\beta}{\alpha + \beta} g_0 \right)^p \\ &\leq (\alpha + \beta)^p (\lambda f_0 + (1 - \lambda) g_0)^p \end{aligned}$$

Now take the integrals of these guys (Jensen's inequality or something like that). In other words,

$$\begin{aligned} \|f + g\|_p^p &\leq (\alpha + \beta)^p \cdot (\lambda \|f_0\|_p^p + (1 - \lambda) \|g_0\|_p^p) \\ &= (\|f\|_p^p + \|g\|_p^p) \cdot 1 \end{aligned} \quad \text{because } f_0 = 1 = g_0.$$

Taking the  $p$ th root,

$$\|f + g\|_p \leq \|f\|_p + \|g\|_p.$$

□

This gives us the last norm-space requirement (triangle inequality of normed spaces).

**Lemma (6.3).** Let  $p \in [1, \infty]$ . Then for  $a, b, t \geq 0$ , we have

$$(a + tb)^p \geq a^p + ptba^{p-1}.$$

*Proof.* Define the function

$$\phi(t) = (a + tb)^p - a^p - ptba^{p-1}.$$

We know  $\phi(0) = 0$ . Take the derivative of this thing and this is greater than zero because

$$\begin{aligned}\phi'(t) &= p(a + tb)^{p-1} + b - pba^{p-1} \\ &= pb((a + bt)^{p-1} - a^{p-1})\end{aligned}$$

and so  $\phi$  is increasing. □

**Theorem (6.4, Holder Inequality).** <sup>1</sup> If  $p$  and  $q$  are nonnegative extended real numbers such that

$$\frac{1}{p} + \frac{1}{q} = 1,$$

and if  $f \in L^p$  and  $g \in L^q$ , then  $f \cdot g \in L^1$  and

$$\int |fg| \leq \|f\|_p \cdot \|g\|_q.$$

---

<sup>1</sup>If  $p, q = 2$ , then this just reduces to the Cauchy-Schwarz inequality.
